endostatin, VI tumor growth.

Claim 7; Page 18; 34pp; English.

The present invention relates to anti-angiogenesis peptides from a portion of a selected from plasminogen, endostatin, VEGF or FLT-1. The invention is used to prevent or treat primary tumour growth or metastasis or undesired angiogenesis

The invention discloses a peptide comprising a portion of a protein e.g. plasminogen, endostatin (Endo-1-4), vascular endothelial growth factor (VEGF), FLT-1 or kinase insert domain containing receptor/FLK-1. These peptides are able to act as potent angiogenic inhibitors (Angio-1-5) inhibiting endothelial cell proliferation and retarding tumour growth. Angiogenesis is the process of new blood vessel formation from precessed, involving endothelial cell proliferation, migration and assembly into tubule structures. It plays an important role in normal physiological functions such as embryonic development and wound healing. Complicions including tumour growth and metastasis, rheumatoid arthritis and psoriasis. Anticancer therapy by inhibiting tumour angiogenesis is conditions including tumour growth and metastasis, rheumatoid arthritis and psoriasis. Anticancer therapy by inhibiting tumour angiogenesis is called antiangiogenic therapy. VEGF is a endothelial specific mitogen that functions through two high affinity tyrosine kinase receptors, FUT-1 and FLK-1 (not defined). Protein-protein interactions are crucial to many physiological and pharmacological processes and the peptides disclosed interactions. The sequences presented in ABG97510-ABG97559 are examples of
                                                                                                                                                                                                                                                                                                                                                                 Novel peptide for preventing/treating undesired angiogenesis, has a portion of a protein e.g. plasminogen, endostatin, and potent antiangiogenic activity and endothelial cell proliferation inhibition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 68; DB 5; I 100.0%; Pred. Angiogenesis is the process of new blood vessel formation from pre-existing vessels. Inappropriate angiogenesis is associated with various pathological. Conditions including solid tumour growth and metastasis. The present peptide can be used to to prevent tumour metastasis or inhibit the growth of a primary tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptides having potent anti-angiogenic activity, useful for the treatment of tumors, comprise a portion of a {\rm FLT}{}^{-1} protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Angiogenesis; plasminogen; endostatin; Endo-; VEGF; vascular endothelial growth factor; FLT-1; kinase insert domain; FLK-1; angiogenic inhibitor; Angio-; endothelial cell; proliferation; tumour growth, blood vessel formation; migration; tubule structure; embryonic development; wound healing; tumour metastasis; rheumatoid arthritis; psoriasis; anticancer; therapy; anticance therapy;

Gene clone of inhibitory factor for hyperplasia of inner blood vessel cells in human body's real tumor, and its use in anti-tumor blood vessel
               of prematurity, macular degeneration, corneal graft rejection, retrolental fibroplasia, rubeosis, capillary proliferation in atherosclerotic plaques and osteoporosis. Other angiogenesis-dependent diseases include Osler-Webber syndrome, myocardial angiogenesis, plaque neovasculisation, telangiectasia, haemophiliac joints and wound granulation. In addition, the peptides can be used as birth control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel preparation which inhibits the proliferation of blood vessel endothelium and prevents the regeneration activity of tumour blood vessels. The preparation can also be used as a biological preparation in the treatment of tumours. This sequence represents the murine endostatin protein described in the invention
 retinopathy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides endostatin peptides which can be used in the modulation of angiogenesis. This is useful in the treatment of cancers, inflammation, rheumatoid arthritis, chronic articular rheumatism, psoriasis, disorders associated with inopportune invasion of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Endostatin; antiangiogenic; angiogenesis; human; mouse; chicken; cancer; inflammation; angiogenesis-dependent disease.
                                                                                                                                                                                                                  Polypeptides derived from endostatin exhibiting antiangiogenic activity useful for treatment of angiogenesis-dependent tumors.
                                                                                                                                                                                                                                                                                                         The present invention describes a number of peptides derived from endostatin which exhibit antianglogenic activity. These may be used in the treatment of cancer. The present sequence is one of the peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Endostatin peptide comprising at least four endostatin amino acid residues are e.g. angiogenesis inhibitors for treating cancer and diabetic retinopathy.

activity, such as angiogenesis dependent cancers, banjan tumours, rheumatoid arthritis, psoriasis, ocular angiogenesis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atheroselerosis, scleroderma, hypertrophic scars, cat scratch disease, Helicobacter pylori ulcers, dialysis graft vascular access stenosis, contraception and obesity. In particular, the methods provide a means for introducing EMI into mammalian cells via gene therapy, for production of EMI via recombinant means, as well as recombinant production of EMI via recombinant means, as well as angiogenic diseases in that increasingly smaller peptides are more potent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence is the mouse endostatin. The invention relates to a the mutant endostatin (EM), which has anti-angiogenic activity, and is designated EMI. Compositions comprising EMI or fusion proteins comprising EMI, are useful for treating diseases characterised by angiogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              angiogenic diseases in that increasingly smaller peptides are more potent
on a weight basis, and may be able to better penetrate tissues
                                                                                                                                                                                benign tumour; rheumatoid arthritis; psoriasis; ocular angiogenesis; oslar-webber Syndrome; myocardial angiogenesis; angiofibroma; cancer; plaque neovascularisation; telangiectasia; atherosclerosis; scleroderma; dialysis graft vascular access stenosis; renal cancer; therapy.
                                                                                                                                                                   endostatin; angiogenesis-dependent cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ; Score 68; DB 2; Length 184;

This invention describes a novel viral gene therapy vector comprising a nucleic acid molecule encoding an anti-angiogenic polypeptide chosen from human or murine andiogenic polypeptide chosen from inhibiting fusions and fragments, where the viral vector is sufficiently attenuated for use in human gene therapy. The products of the invention have anti-angiogenic, cytostatic, anti-diabetic and ophthalmological activity. The vector is used in gene therapy for inhibiting tumour growth in humans harbouring a solid tumour. The vector expresses an anti-angiogenic polypeptide. An additional use comprises treatment of diabetic retinopathy, where the anti-angiogenic polypeptide inhibits angiogenesis in the vicinity of the retina. The vector is administered to cells exvivo and then administered to the patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```
a signal sequence, an immunoglobulin For region, an angiogenesis inhibitor selected from angiostatin, endostatin, a plasminogen fragment having angiostatin activity, a collagen XVIII fragment having endostatin activity, or combinations of them. The funion protein (immunofusin) is used to inhibit angiogenesis and to treat diseases or conditions mediated by angiogenesis. Conditions that may be treated include solid tumours, by angiogenesis. Conditions metastasis, benign tumours including mediated became angiogenesis. Conditions metastasis, benign tumours including the memangiomas, acoustic neuromas, neurofibromas, trachomas and pyrogenic standomas, frbumuatoid arthritis, psoriasis, ocular angiogenic diseases e.g. diabetic retinopathy, retinopathy of prematurity macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental confibroplasia, rubeosis and osler-webber syndrome; myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints' angiofibroma, wound granulation, and excessive or abnormal stimulation of endothelial cells, intestinal cells, atherosclerosis, sclerodermal and hypertrophic scars, i.e. keloid scars. The DNA constructs may be used in the construction of immunofusin murine immunoglobulin Fc fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                Novel fusion protein of angiostatin or endostatin and an immunoglobulin FC region, useful for treating conditions mediated by angiogenesis, such as rheumatoid arthritis, tumors and macular degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Endostatin; antiangiogenic; angiogenesis; human; mouse; chicken; cancer; inflammation; angiogenesis-dependent disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The patent discloses a DNA molecule encoding a fusion protein comprising
metastasis; atherosclerosis; psoriasis; rheumatoid arthritis; ocular angiogenic disease; diabetic retinopathy; macular degeneration; myocardial angiogenesis; plaque neovascularisation; telangiectasia; wound granulation; keloid scar; gene therapy.

                                                                                                                                                                                                                                                                  The present invention provides endostatin peptides which can be used in the modulation of angiogenesis. This is useful in the treatment of cancers, inflammation, rheumatoid arthritis, chronic articular rheumatism, psoriasis, disorders associated with inopportune invasion of prematurity, macular degeneration, corneal graft rejection, retrolental fibroplasia, tubososis, capillary proliferation in atherosclerotic plaques and osteoporosis. Other angiogenesis-dependent diseases include osler-webber syndrome, mycoardial angiogenesis, plaque neovasculisation, telangiectasia, haemophiliac joints and wound granulation. In addition, the peptides can be used as birth control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gapa

The present invention relates to anti-Vascular Endothelial Growth Factor (VEGF) antibodies that bind to the same epitope as the monoclonal antibody ATCC PFA 1595 and which significantly inhibit VEGF binding to the VEGF receptor VEGFR2, without inhibiting VEGF binding to the VEGF receptor VEGFR1. The present sequence is murine endostatin. Endostatin may be conjugated onto the anti-VEGF antibodies of the present invention. The anti-VEGF antibodies of the present invention are useful for the treatment and diagnosis of cancer, especially vascularised solid tumours
neovascularisation, choroidal neovascularisation, retinal neovascularisation, age-related macular degeneration, visual impairment, occular dysfunction, loss of vision, retinopathy, or blindness in a human. The present sequence is a protein shown in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Immunogenic composition for the treatment and diagnosis of cancer comprises an anti-VEGF (vascular endothelial growth factor) antibody binding the same epitope as the monoclonal antibody ATCC PTA 1595.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Murine; endostatin; cytostatic; antiproliferative; vascular endothelial growth factor; VEGF; antibody; VEGF2 receptor; cancer; vascularised solid tumour.

                                                                    New peptide useful for the preparation of medicaments with antiangiogenic activity that may be used in treating tumors or metastases, comprises a sequence corresponding to fragments of human endostatin.
                                                                                                                                                                                                                     sequences corresponding to the human endostarin polymeptide sequence, its salt or non-toxic derivative. The peptides are useful in the preparation of medicaments with antianglogenic activity which may be useful in treating tumours or metastages. This sequence represents a human endostatin polymeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to an adeno-associated viral (AAV) vector comprising a polynucleotide that comprises a nucleic acid segment that encodes a choroidal or ocular neovascularisation inhibitory polypeptide operably linked to a promoter that expresses the segment to produce the polypeptide in a selected mammalian host cell. Such a vector is useful for providing a choroidal or coular neovascularisation inhibitory polypeptide to a mammal, for use in the therapy of ocular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel adeno-associated viral vector comprising polynucleotide encoding pigment epithelium-derived factor, useful for treating choroidal neovascularization, blindness, loss of vision.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                       The invention relates to peptide comprising 20-50 amino acids with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vector, rAAV, recombinant adeno-associated viral vector, anti-angiogenesis, PEDF; angiogenesis, eye disorder; blindness, retinal degeneration, macular degeneration, neovascularisation,

The present invention relates to antibody-based compositions comprising an immunoconjugate such as anti-vascular endothelial growth factor (VEGF) antibody (Ab) (or its antigen-binding fragment), attached to a biological agent, where the Ab binds to the same epitope as the monoclonal antibody (MAD) 2C3 ATC PTA 1595, and significantly inhibits VEGF binding to the VEGF receptor VEGFR2 (KDK/Plk-1) without inhibiting VEGF binding to the VEGF receptor VEGFR2 (KDK/Plk-1) without inhibiting vEGF binding to the VEGF receptor VEGFR2 (KDK/Plk-1). The compositions of the invention are useful in therapy, and diagnosis, for inhibiting angiogenesis in an inmal having ocular neovascular disease or macular degeneration, and for delivering a biological agent to a vascularised tumour. The compositions can also be used for treating cancer and subjects at risk of developing, a vascularised solid tumour, a metastatic tumour or metastases from a primary tumour. The composition is useful for specifically inhibiting the variation without significantly inhibiting the variation when the subjects at the composition is the confidence of the composition of the confidence of the composition is useful for specifically inhibiting the variation when the subjects at the confidence of the composition is useful for specifically inhibiting the variation when the confidence of the composition is useful for the confidence of the composition is useful for the confidence of the composition of the confidence of the composition is useful for confidence of the composition of the confidence of the composition is useful for confidence of the composition of the confidence of the composition of the confidence of the confidence of the composition of the confidence of the confidence of the confidence of the confidence of the composition of the confidence of the confidence of the composition of the confidence of the conf
Immunoconjugate compositions for treating cancer by inhibiting angiogenesis and for delivering a diagnostic agent to tumor, comprises anti-vascular endothelial growth factor antibody attached to a biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  inhibiting VEGF-induced macrophage, osteoclast or chondroclast function. The compositions can be used for treating various diseases such as inflammatory disorders, atherosclerosis, diabetic retinopathy. restenosis, acquired immune deficiency syndrome (AIDS), blood borne tumours, corneal graft rejection, Crohn's disease, fungal ulcers, infections, sickle cell anaemia, and endomerriosis. The present sequence represents mouse endostatin. Endostatin may be attached or functionally associated with anti-VEGF antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 10; Page 11-12 (Sequence listing); 299pp; English.

The invention relates to fusion protein comprising a nucleotide-binding domain (NBD), a ligand-binding domain (LBD) of an intracellular receptor (ICR) and a transcription regulating domain (TRD). NBD is a polydactyl zinc finger protein (ZFP), or a modular part of it, that interacts fusion protein functions as a ligand-activated transcriptional regulator. The fusion protein and the nucleic acid encoding it, are used to regulate gene expression, particularly in gene therapy for treating malignant cell proliferative diseases (e.g. colon cancer, prostate cancer, renal-cell carcinoma) and non-malignant cell proliferative diseases (e.g. psoriasis, penphigus vulgaris, Behcef's syndrome and lipid histiocytosis). The fusion protein and its DNA are also useful for treating diseases caused by vulgaris, in humans/plants, genetic and/or acquired diseases. The fusion protein can be designed to target any selected gene (endogenous or exogenous or exogenous or exogenous I gands. The present sequence is murine for the present sequence is murine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        endostatin fused to an N-terminal secretion signal. The corresponding cDNA sequence was used in the construction of Left end shuttle plasmids containing regulatable transgene cassettes for evaluation of Cys2-His2 Zinc finger DNA binding domain (DBD)-Oestrogen receptor (ER) LBD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ouery Match

                                                                                                                                                                                                                                                                                      US-09-405-499-1

Sequence 1, Application US/09405499

Sequence 1, Application US/09405499

Patent No. USZ0020123458A1

APPLICANT: O'Reilly, Michael

APPLICANT: Polkman, M. Judah

TITLE OF INVENTION: Endostatin Protein and Fragments Thereof

FILE REFERRNCE: 05213-0640

CURRENT APPLICATION NUMBER: US/09/405,499

CURRENT FILING DATE: 1999-09-23

NUMBER OF SEQ ID NOS: 3

SOFTWARE: PatentIn Ver. 2.0

-!- SIMILARITY: Belongs to the fibril-associated collagens with interrupted helices (FACIT) family.
-!- SIMILARITY: Contains 1 frizzled (FZ) domain.
Name=1; Synonyms=NC1-764;
IsoId=P39061-3; Sequence=Displayed;
Name=2; Synonyms=Long, NC1-517;
IsoId=P39061-1; Sequence=VSP 008303;
Note=Produced by alternative=splicing of isoform 1;
Name=3; Synonyms=Short, NC1-301;
IsoId=P39061-2; Sequence=VSP 001157, VSP 001158;
-!- TISSUE SPECIFICITY: Expressed in liver, kidney, lung, skeletal muscle and testis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             IDA.

position 1437 and prostate cancer. Heterozygous Asn-1437 individuals have a 2.5 times increased chance of developing prostate cancer as compared with homosygous Asp-1437 individuals.

-!- DISEASE. Defects in COL1841 are a cause of Knobloch syndrome (KNO) [MIN:26750]; an autosomal recessive disorder defined by the occurrence of high myopia, vitreoretinal degeneration with retinal detachment, macular abnormalities and occipital encephalocele.
-!- SIMILARITY: Belongs to the fibril-associated collagens with interrupted helices (FACIT) family.
-!- SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ALIGNMENTS

RESULT 1 A56101 collagen alpha 1(XVIII) chain precursor, short splice form - mouse N;Contains: endostatin C:Species: Mus musculus (house mouse)
C;Date: 03-Oct-1995 #sequence revision 08-May-1998 #text_change 09-Jul-2004 C;Accession: A56101; A58371; \$72450; S65595 R;Rehn, W; Pihajaniemi, T.
Aritle: Identification of three N-terminal ends of type XVIII collagen chains and tissu tif homologous to rat and Drosophila frizzled proteins.
 Arcession: A55101 Armolecule type: mRNA Armolecule in a mRNA
 A;Cross-references: UNIRROT.P39061; GB:U11636; NID:g618427; PIDN:AAC52178.1; PID:g61842 R;Rehn, M.; Pihlajaniemi, T.

As3117, Accession. Annuary (XV) chain precursor - human (SA3317)

Collagen alpha 1(XV) chain precursor - human (SA3317)

Collagen alpha 1(XV) chain precursor - human (SA317)

Collagen alpha 1(XV) chain appear alpha 1000

Cybecies: Homo saplems (man)

Asili, Chem. 269, 4713-4719, 1994

Apitite: Primary structure of the alpha chain of human type XV collagen and exon-intron Apieterence number: A53117; MUID: 94148920; PMID: 8106446

Apitite: Primary structure of the alpha chain of human type XV collagen and exon-intron Apieterence number: A53117; MUID: 94148920; PMID: 8106446

Apitite: The human alpha (XV)

Ap
A;Note: in the authors' translation, 482-Gly is not shown, residues 483.490 are shifted C;Comment: Prolines and lysines at the third position of the tripeptide repeating unit (lated and subsequently O-glycosylated.

C;Comment: Different splice forms of collagen alpha 1(XVIII) may be involved in perivase C;Comment: Endostatin is released from collagen alpha 1(XVIII) chain by the action of un C;Genetics:

Sequence 55246, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:

TILLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster:

FILLE REFERENCE: File Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270, 767

CURRENT FILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: Patentin Ver. 2.0

LENGTH: 151
                                                                                                                                                                                                       US-09-270-767-40030

Sequence 13, Application US/09561108

Patent No. 6342221

GREERAL INFORMATION:
APPLICANT: Philip E. Thorpe
APPLICANT: Rolf A. Brekken
TITLE OF INVENTION:
TITLE OF INVENTION: ANTIBODY CONJUGATE COMPOSITIONS FOR SELECTIVELY INHIBITING VEGF
TITLE APPLICATION NUMBER: US/09/561,108
CURRENT FILING DATE: 2000-04-28
PRIOR PRILICATION NUMBER: 60/131,432
PRIOR PRILING DATE: 1999-04-28
NUMBER OF SEQ ID NOS: 44
SOFUMARE: Patentin Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

```
JULIANCE J. Application US/10402312

Patent No. 6833261

GENERAL INFORMATION:

APPLICANT: Estell, David A.

TITLE OF INVENTION: Proceases From Gram-Positive Organisms
FILE REFERENCE: GC382-US

CURRENT APPLICATION NUMBER: US/10/402,312

CURRENT FILING DATE: 2003-03-26

PRIOR APPLICATION NUMBER: PCT/US98/14647

PRIOR APPLICATION NUMBER: PCT/US98/14647

PRIOR APPLICATION NUMBER: EP 97305237.7

PRIOR PILING DATE: 1998-07-15

NUMBER OF SEQ ID NOS: 10

SOFTWARE: FastSEQ for Windows Version 3.0

SEQ ID NO 3

LENGTH: 818
                                                                                                                           GENERAL INFORMATION:
